## FOREWORD

This report is an adjunct to IHTR 2269, which addressed the explosive contamination levels to which surfaces needed to be cleaned before being released for unrestricted use per DOD 6055.1. This report deals with five additional energetic materials—HMX, TATB, HBNQ, NC, and tetryl. Also, the three original energetic materials, TNT, RDX, and AP, were tested for sensitivity on wood surfaces at the 750- $\mu\text{g}/\text{cm}^2$  level. This report should be used in concert with IHTR 2269.

This work was performed at the Indian Head Division, Naval Surface Warfare Center.

## BACKGROUND

The downsizing and closing of military establishments have generated the need to eliminate potential hazards from facilities previously used to process energetic materials. Testing for contamination levels is an established practice; however, there are no established criteria for safe and acceptable levels of contamination of facilities.

To establish levels of contamination with appropriate safety factors that could be shown not to exhibit reactions to normally executed construction practices, such as equipment installation and facility remodeling, small-scale sensitivity testing was performed. Wood, concrete, and metal anvils and plates were prepared for use in the sensitivity equipment and then coated with a quantifiable amount of contaminant on the testing surface. These plates and anvils were then subjected to impact, friction, and electrostatic discharge (ESD) sensitivity testing and observed for reactions to the stimuli.

IHTR 2269, *Sensitivity Testing of Contaminated Surfaces to Establish Non-Reactivity Levels of Ammonium Perchlorate, Cyclotrimethylenetrinitramine, and Trinitrotoluene on Wood, Concrete, and Metal*, 30 June 2000, reported on previous testing with AP, RDX, and TNT. This report gives results of testing with five additional materials—HMX (cyclotetramethylenetetranitramine), TATB (triaminotrinitrobenzene), HBNQ (high-bulk-density nitroguanidine), NC (nitrocellulose), and tetryl (trinitrophenylmethylnitramine). Also reported is the sensitivity of the three original materials on wood surfaces at the 750- $\mu\text{g}/\text{cm}^2$  level.

## **APPROACH**

We used several time-honored sensitivity tests for the hazard classification of energetic materials:

- Naval Ordnance Station (NOS) Impact Test
- Alleghany Ballistic Lab (ABL) Friction Test
- ABL Electrostatic Discharge test

These tests cover the gamut of stimuli expected to be experienced during the demolition/decontamination effort.

The procedures for these tests are well defined including the assembly of the test apparatus and preparation of the specimen to be tested. The anvils/plates reflected the surfaces expected to be encountered—metal, wood, or concrete. To determine the level to which contaminated surfaces must be cleaned, plates/anvils containing increasing quantities of the energetic material were tested on the above apparatus until a “reaction” was achieved. The level to which a surface must be cleaned was the next lowest level and one in which no reaction was achieved. Since friction is the stimulus to be experienced most often, the maximum pressure of 980 psig was assigned to depict the “worst case” situation.

To assure consistent and accurate deposition on the plates/anvils, the energetic materials were dissolved in an appropriate solvent to a specified concentration. A pipette was used to apply the energetic material to the surface.

Directions for sample preparation and testing were communicated to the laboratories via action memoranda (Appendix A).

## DISCUSSION OF RESULTS

1. The results as reported by the laboratories (Appendix B) are straightforward and confirm engineering analysis of on-site evaluations. However, one anomaly occurred in the HMX series. The 200- $\mu\text{g}/\text{cm}^2$  sample reacted on the steel anvil while the 500- $\mu\text{g}/\text{cm}^2$  sample did not. This anomaly dictated a retest of the HMX series especially since the RDX series exhibited reactions on steel at 100  $\mu\text{g}/\text{cm}^2$  with no reaction at 75  $\mu\text{g}/\text{cm}^2$ .
2. All the contaminants presented “no reaction” at concentrations up to and including 750  $\mu\text{g}/\text{cm}^2$  on wood and concrete in the friction and impact tests.
3. All concentrations (50, 75, 100  $\mu\text{g}/\text{cm}^2$ ) had at least one reaction to ESD. Examination of the anvils/plates indicated only a minimal reaction.
4. Review of Appendix E of IHTR 2269 demonstrates “no reactions” at pressures below 980 psig on RDX. This supports the contention that 980 psig represents the “worse case” situation.
5. Post-test inspections of the concrete-filled friction plates and raw test data indicated that the concrete did not hold up to the friction wheel testing set at 980-psig pressure. Further evaluation of material preparation is necessary. It is reasonable to use the non-reactive levels reported on the steel friction plates for clearance.

## CONCLUSIONS

1. Structure surfaces need to be cleaned/decontaminated to  $750 \mu\text{g}/\text{cm}^2$  or less. Steel surfaces (equipment) must be cleaned to  $500 \mu\text{g}/\text{cm}^2$  or less.
2. To preclude initiation by ESD, all hands must be “grounded” in the mode specified in ordnance industry safety manuals—conductive shoes/ground straps, cotton clothing, etc.
3. The HMX friction series was repeated with reactions at 100, 200 and  $500 \mu\text{g}/\text{cm}^2$  per Memorandum Report No. 3 (Appendix B). This validated the original no-reaction levels of 50 and  $75 \mu\text{g}/\text{cm}^2$ .

Subj: Test Sample Preparation, Request for

1. Please prepare the plates and anvils provided with the energetics listed below by applying the required quantity of solution (solvent as indicated) to realize the level of contamination listed.
2. Please provide a copy of your calculations of solution concentrations and quantity of solution to be applied for each contaminant level.

| Table 1. Required contamination |                        |   |          |
|---------------------------------|------------------------|---|----------|
| Contaminant                     | Contaminant level      | Substrates                                    | Test     |

**ACTION MEMORANDUM NO. 2**

To: Sensitivity Lab  
 From: Anne Caris 2150K

Subj: Sensitivity Testing, Request for

1. Please perform tests listed in the tables below.
2. The plates and anvils will be delivered pre-contaminated and labeled to level of contaminations.
3. Total number of friction plates to be tested = 58. Total number of impact anvils to be tested = 54. Total number of ESD anvils to be tested = 300.
4. Please provide results per memorandum as soon as possible.

| Table 1. Summary of required friction sensitivity tests |             |  |   |  |

**MEMORANDUM REPORT NO. 1**

To: Anne Caris 2150K  
 From: Laura Tinsley 3320J

Subj: Calculations to determine amount of standard solution to be applied to each testing surface.

Friction plate surface area =  $10 \text{ cm} \times 4 \text{ cm} = 40 \text{ cm}^2$   
 Impact anvil surface area =  $(3.14159) \times (3.175/2 \text{ cm})^2 = 7.54 \text{ cm}^2$   
 ESD anvil surface area =  $(3.14159) \times (.3175 \text{ cm})^2 = 0.32 \text{ cm}^2$

Contamination levels for friction plates: 50, 75, 100, 200, 750 micrograms per square centimeter  
 Contamination levels for impact anvils: 200, 500, 750 micrograms per square centimeter  
 Contamination levels for ESD anvils: 50, 75, 100 micrograms per square centimeter

HBNQ standard solution is 0.01 grams/100 milliliter

for ESD anvil =  $(50 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) = 16 \mu\text{g}$

$$\begin{aligned} (100 \text{ ml}/0.01\text{g}) &= (x/16 \mu\text{g}) & X &= (16 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 0.16 \text{ ml or } 160 \mu\text{l} \\ &= (75 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) = 24 \mu\text{g} \\ (100 \text{ ml}/0.01\text{g}) &= (x/24 \mu\text{g}) & X &= (24 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 0.24 \text{ ml or } 240 \mu\text{l} \\ &= (10 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) = 32 \mu\text{g} \\ (100 \text{ ml}/0.01\text{g}) &= x/32 \mu\text{g} & X &= (32 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 0.32 \text{ ml or } 320 \mu\text{l} \end{aligned}$$

for impact anvils =  $(50 \mu\text{g}/\text{cm}^2)(7.54 \text{ cm}^2) = 377 \mu\text{g}$

$$\begin{aligned} (100 \text{ ml}/0.01\text{g}) &= (x/377 \mu\text{g}) & X &= (377 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 3,770,000 \text{ ml or } \\ &= (75 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) = 24 \mu\text{g} \\ (100 \text{ ml}/0.01\text{g}) &= (x/24 \mu\text{g}) & X &= (24 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 0.24 \text{ ml or } 240 \mu\text{l} \\ &= (100 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) = 32 \mu\text{g} \\ (100 \text{ ml}/0.01\text{g}) &= (x/32 \mu\text{g}) & X &= (32 \mu\text{g})(100 \text{ ml})/(0.01\text{g}) = 0.32 \text{ ml or } 320 \mu\text{l} \end{aligned}$$

TATB standard solution is 0.004 g/100 milliliter

$$\begin{aligned} (50 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) &= 16 \mu\text{g} \\ (100 \text{ ml}/0.004\text{g}) &= (x/16 \mu\text{g}) & X &= (16 \mu\text{g})(100 \text{ ml})/(0.004\text{g}) = 0.4 \text{ ml or } 400 \mu\text{l} \\ (75 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) &= 24 \mu\text{g} \\ (100 \text{ ml}/0.004\text{g}) &= (x/24 \mu\text{g}) & X &= (24 \mu\text{g})(100 \text{ ml})/(0.004\text{g}) = 0.6 \text{ ml or } 600 \mu\text{l} \\ (100 \mu\text{g}/\text{cm}^2)(0.32 \text{ cm}^2) &= 32 \mu\text{g} \\ (100 \text{ ml}/0.004\text{g}) &= (x/32 \mu\text{g}) & X &= (32 \mu\text{g})(100 \text{ ml})/(0.004\text{g}) = 0.8 \text{ ml or } 800 \mu\text{l} \end{aligned}$$

**MEMORANDUM REPORT NO. 2**

To: Anne Caris 2150K  
From: Dan Remmers 9410G  
Subj: Sensitivity Testing for Contaminated Steel, Wood, and Concrete  
Ref: (a) Request by A. Caris, Code 2150K on 16 August 2000.

1. As requested by reference (a), small scale safety testing was performed on concrete, steel, and wood contaminated with HMX, TATB, HBNQ, NC, tetryl, TNT, RDX, and AP. The tests and results are explained below, and the individual test worksheets were provided.

2. ABL Friction

HMX: The 200  $\mu\text{g}/\text{cm}^2$  concentration on the steel anvil had a positive reaction at 980 psig. All other concentrations on steel (50, 75, 100, 500  $\mu\text{g}/\text{cm}^2$ ) had no reactions at 980 psig.

All HMX concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All HMX concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

TATB: All TATB concentrations on steel anvils (50, 75, 100, 200, 500  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All TATB concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All TATB concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

HBNQ: All HBNQ concentrations on steel anvils (50, 75, 100, 200, 500  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All HBNQ concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All HBNQ concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

NC: All NC concentrations on steel anvils (75, 100, 200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All NC concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All NC concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

tetryl: The 100, 200, and 500  $\mu\text{g}/\text{cm}^2$  concentrations on steel had a positive reaction at 980 psig. All other concentrations on steel (50, 75  $\mu\text{g}/\text{cm}^2$ ) had no reactions at 980 psig.

All tetryl concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

All tetryl concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions.

TNT: 750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

RDX: 750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

AP: 750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

### 3. NOS Impact

HMX: All HMX concentrations on steel anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All HMX concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All HMX concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

TATB: All TATB concentrations on steel anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All TATB concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All TATB concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

HBNQ: All HBNQ concentrations on steel anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All HBNQ concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All HBNQ concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

NC: The 750  $\mu\text{g}/\text{cm}^2$  concentration on the steel anvil had a positive reaction at the 1000 mm drop height. All other concentrations on steel (200, 500  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All NC concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All NC concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

tetryl: All tetryl concentrations on steel anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All tetryl concentrations on wood anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

All tetryl concentrations on concrete anvils (200, 500, 750  $\mu\text{g}/\text{cm}^2$ ) had no reactions at the 1000 mm drop height.

TNT: 750  $\mu\text{g}/\text{cm}^2$  on the steel anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the concrete anvil had no reactions.

RDX: 750  $\mu\text{g}/\text{cm}^2$  on the steel anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the concrete anvil had no reactions.

AP: 750  $\mu\text{g}/\text{cm}^2$  on the steel anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the wood anvil had no reactions.

750  $\mu\text{g}/\text{cm}^2$  on the concrete anvil had no reactions.

4. ABL Electrostatic Discharge

All concentrations (50, 75, 100  $\mu\text{g}/\text{cm}^2$ ) of all contaminants had at least one reaction to electrostatic discharge. The individual test sheets were provided, along with a list of the pin number and the reaction. The NC contaminated pins were retested.

5. The tests were completed on November 2, 2000. Testing was conducted at NSWC Indian Head, in the Hazard Characterization Lab, Building 888. If there are any questions, please call the Hazard Characterization Group at 301-744-4109 or send a FAX at 301-744-4116.

Subj: SENSITIVITY TESTING FOR HMX CONTAMINATED STEEL

Ref: (a) Request by A. Caris, Code 2150K on 6 February 2001.

1. As requested by reference (a), ABL friction testing was performed on steel contaminated with HMX. The concentrations provided were 200 and 500  $\mu\text{g}/\text{cm}^2$ .
2. Both the 200 and 500  $\mu\text{g}/\text{cm}^2$  concentrations on the steel anvil had positive reactions at 980 psig. The individual worksheets are attached.
3. The tests were completed on February 13, 2001. Testing was conducted at NSWC Indian Head, in the Hazard Characterization Lab, Building 888. If there are any questions, please call the Hazard Characterization Group at 301-744-4109 or send a FAX at 301-744-4116.
